UniFork Open-source code and license

Open-source software (OSS) is computer software made available under a license that accords users the freedom to use, examine, modify, and disseminate the program and its source code to anyone and for any reason. The license defines the guidelines to anyone interested in using the code on how it may be applied. Thus, open-source software is as much a social contract as it is a legal agreement.

There are several types of open-source license such as:

- ❖ Apache License 2.0.
- ❖ BSD 3-Clause "New" or "Revised" license.
- ❖ BSD 2-Clause "Simplified" or "FreeBSD" license.
- ❖ GNU General Public License (GPL)
- ❖ GNU Library or "Lesser" General Public License (LGPL)
- ❖ MIT license.
- ❖ Mozilla Public License 2.0.
- ❖ Common Development and Distribution License.
- ❖ etc

We are using GNU GPL license

GPL V3 features

- ❖ More compatible with code using other licenses

- ❖ Protect GPL v3 code from use in freedom or privacy restricting software

- ❖ GPL code cannot be mixed with propriety code together.

- ❖ Patent protection for people using GPL v3 code subject to patents

How to apply the license to the Capstone project

Add the GNU GPL license file named COPYING to the root folder of the application
